

Document made available under the Patent Cooperation Treaty (PCT)

International application number: PCT/US2005/007708

International filing date: 09 March 2005 (09.03.2005)

Document type: Certified copy of priority document

Document details: Country/Office: US
Number: PCT/US2004/014527
Filing date: 24 May 2004 (24.05.2004)

Date of receipt at the International Bureau: 30 October 2006 (30.10.2006)

Remark: Priority document submitted or transmitted to the International Bureau in compliance with Rule 17.1(a) or (b)

World Intellectual Property Organization (WIPO) - Geneva, Switzerland
Organisation Mondiale de la Propriété Intellectuelle (OMPI) - Genève, Suisse

REC'D 30 OCT 2006
WIPO PCT

P2 1525774

THE UNITED STATES OF AMERICA

TO ALL TO WHOM THESE PRESENTS SHALL COME:

UNITED STATES DEPARTMENT OF COMMERCE
United States Patent and Trademark Office

October 19, 2006

THIS IS TO CERTIFY THAT ANNEXED HERETO IS A TRUE COPY OF
THE BELOW IDENTIFIED INTERNATIONAL APPLICATION AS
ORIGINALLY FILED AND ANY CORRECTIONS THERETO FROM THE
RECORDS OF THE UNITED STATES PATENT AND TRADEMARK
OFFICE ACTING AS A RECEIVING OFFICE UNDER THE PATENT
COOPERATION TREATY.

APPLICATION NUMBER: *PCT/US04/14527*
FILING DATE: *May 24, 2004*

By Authority of the
Under Secretary of Commerce for Intellectual Property
and Director of the United States Patent and Trademark Office

T. Wallace
T. WALLACE
Certifying Officer

Rec'd PCT/PTO 24 MAY 2004

PCT/US04/14527
TRANSMITTAL LETTER TO THE
UNITED STATES RECEIVING OFFICE

Date	May 24, 2004

II. ☐ New International Application

TITLE	SKIN TANNING AND LIGHT THERAPY SYSTEM AND METHOD
-------	--

Earliest priority date (Day/Month/Year)
24/05/2003 24/May/2003

SCREENING DISCLOSURE INFORMATION: In order to assist in screening the accompanying international application for purposes of determining whether a license for foreign transmittal should and could be granted and for other purposes, the following information is supplied. (Note: check as many boxes as apply):

- A. ☐ The invention disclosed was **not** made in the United States.
 B. ☐ There is no prior U.S. application relating to this invention.
 C. ☒ The following prior U.S. application(s) contain subject matter which is related to the invention disclosed in the attached international application. (NOTE: *priority to these applications may or may not be claimed on form PCT/RO/101 (Request) and this listing does not constitute a claim for priority*)

application no.	60/473,237	filed on	24/May/2004 (24/05/2004)
application no.	More on separate sheet	filed on	

- D. ☒ The present international application contains additional subject matter not found in the prior U.S. application(s) identified in paragraph C. above. The additional subject matter is found on pages **THROUGHOUT**

and ☐ DOES NOT ALTER ☒ MIGHT BE CONSIDERED TO ALTER the general nature of the invention in a manner which would require the U.S. application to have been made available for inspection by the appropriate defense agencies under 35 U.S.C. 181 and 37 CFR 5.1. See 37 CFR 5.15.

III. ☐ A Response to an Invitation from the RO/US. The following document(s) is (are) enclosed:

- A. ☐ A Request for An Extension of Time to File a Response
 B. ☐ A Power of Attorney (General or Regular)
 C. ☐ Replacement pages:

pages		of the request (PCT/RO/101)	pages		of the figures
pages		of the description	pages		of the abstract
pages		of the claims			

- D. ☐ Submission of Priority Documents

Priority document		Priority document	
-------------------	--	-------------------	--

- E. ☐ Fees as specified on attached Fee Calculation sheet form PCT/RO/101 annex

IV. ☐ A Request for Rectification under PCT Rule 91 ☐ A Petition ☐ A Sequence Listing Diskette

V. ☐ Other (please identify):

The person signing this form is the:	<input type="checkbox"/> Applicant

REQUEST

The undersigned requests that the present international application be processed according to the Patent Cooperation Treaty.

For receiving Office use only	
International Application No.	PCT/US 04/14527
International Filing Date	24 MAY 2004 (24.05.04)
PCT INTERNATIONAL APPLICATION RO/US	
Name of receiving Office and "PCT International Application"	
Applicant's or agent's file reference (if desired) (12 characters maximum)	043844-0102

Box No. I	TITLE OF INVENTION <i>SKIN TANNING AND LIGHT THERAPY SYSTEM AND METHOD</i>	
Box No. II	APPLICANT <input type="checkbox"/> This person is also inventor.	
Name and address: <i>(Family name followed by given name; for a legal entity, full official designation. The address must include postal code and name of country. The country of the address indicated in this Box is the applicant's State (that is, country) of residence if no State of residence is indicated below.)</i> LEDEEP, LLC 1223 Peoples Avenue Troy, NY 12180 United States of America		Telephone No. 518-276-2374 Facsimile No. 518-276-2374 Teleprinter No. Applicant's registration No. with the Office
State (that is, country) of nationality: US		State (that is, country) of residence: US
This person is applicant for the purposes of: <input type="checkbox"/> all designated States <input checked="" type="checkbox"/> all designated States except the United States of America <input type="checkbox"/> the United States of America only <input type="checkbox"/> the States indicated in the Supplemental Box		
Box No. III	FURTHER APPLICANT(S) AND/OR (FURTHER) INVENTOR(S)	
Name and address: <i>(Family name followed by given name; for a legal entity, full official designation. The address must include postal code and name of country. The country of the address indicated in this Box is the applicant's State (that is, country) of residence if no State of residence is indicated below.)</i> FISET, Peter Depew 5 Upper Loudon Road Loudonville, NY 12211 United States of America		This person is: <input type="checkbox"/> applicant only <input checked="" type="checkbox"/> applicant and inventor <input type="checkbox"/> inventor only <i>(If this check-box is marked, do not fill in below.)</i> Applicant's registration No. with the Office
State (that is, country) of nationality: US		State (that is, country) of residence: US
This person is applicant for the purposes of: <input type="checkbox"/> all designated States <input type="checkbox"/> all designated States except the United States of America <input checked="" type="checkbox"/> the United States of America only <input type="checkbox"/> the States indicated in the Supplemental Box		
<input type="checkbox"/> Further applicants and/or (further) inventors are indicated on a continuation sheet.		
Box No. IV	AGENT OR COMMON REPRESENTATIVE; OR ADDRESS FOR CORRESPONDENCE	
The person identified below is hereby/has been appointed to act on behalf of the applicant(s) before the competent International Authorities as: <input checked="" type="checkbox"/> Agent <input type="checkbox"/> common representative		
Name and address: <i>(Family name followed by given name; for a legal entity, full official designation. The address must include postal code and name of country.)</i> MAEBIUS, Stephen B. FOLEY & LARDNER LLP Washington Harbour 3000 K Street, N.W. Washington, D.C. 20007-5143 United States of America		Telephone No. (202) 672-5569 Facsimile No. (202) 672-5399 Teleprinter No. Agent's registration No. with the Office 35,264
<input type="checkbox"/> Address for correspondence: Mark this check-box where no agent or common representative is/has been appointed and the space above is used instead to indicate a special address to which correspondence should be sent.		

Supplemental Box

If the Supplemental Box is not used, this sheet should not be included in the request.

1. If, in any of the Boxes, except Boxes Nos. VIII(i) to (v) for which a special continuation box is provided, the space is insufficient to furnish all the information: in such case, write "Continuation of Box No. ..." (indicate the number of the Box) and furnish the information in the same manner as required according to the captions of the Box in which the space was insufficient, in particular:

- (i) if more than two persons are involved as applicants and/or inventors and no "continuation sheet" is available: in such case, write "Continuation of Box No. III" and indicate for each additional person the same type of information as required in Box No. III. The country of the address indicated in this Box is the applicant's State (that is, country) of residence if no State of residence is indicated below;
 - (ii) if, in Box No. II or in any of the sub-boxes of Box No. III, the indication "the States indicated in the Supplemental Box" is checked: in such case, write "Continuation of Box No. II" or "Continuation of Box No. III" or "Continuation of Boxes No. II and No. III" (as the case may be), indicate the name of the applicant(s) involved and, next to (each) such name, the State(s) (and/or, where applicable, ARIPO, Eurasian, European or OAPI patent) for the purposes of which the named person is applicant;
 - (iii) if, in Box No. II or in any of the sub-boxes of Box No. III, the inventor or the inventor/applicant is not inventor for the purposes of all designated States or for the purposes of the United States of America: in such case, write "Continuation of Box No. II" or "Continuation of Box No. III" or "Continuation of Boxes No. II and No. III" (as the case may be), indicate the name of the inventor(s) and, next to (each) such name, the State(s) (and/or, where applicable, ARIPO, Eurasian, European or OAPI patent) for the purposes of which the named person is inventor;
 - (iv) if, in addition to the agent(s) indicated in Box No. IV, there are further agents: in such case, write "Continuation of Box No. IV" and indicate for each further agent the same type of information as required in Box No. IV;
 - (v) if, in Box No. VI, there are more than three earlier applications whose priority is claimed: in such case, write "Continuation of Box No. VI" and indicate for each additional earlier application the same type of information as required in Box No. VI;
2. If the applicant intends to make an indication of the wish that the international application be treated, in certain designated States, as an application for a patent of addition, certificate of addition, inventor's certificate of addition or utility certificate of addition: in such a case, write the name or two-letter code of each designated State concerned and the indication "patent of addition, "certificate of addition, "inventor's certificate of addition" or "utility certificate of addition," the number of the parent application or parent patent or other patent grant and the date of grant of the parent patent or other patent grant or the date of filing of the parent application (Rules 4.11(a)(iii) and 49bis.1(a) or (b)).
3. If the applicant intends to make an indication of the wish that the international application be treated, in the United States of America, as a continuation or continuation-in-part of an earlier application: in such case, write "continuation" or "continuation-in-part" and the number and the filing date of the parent application (Rules 4.11(a)(iv) and 49bis.1(d)).

Box No. V DESIGNATIONS

The filing of this request constitutes under Rule 4.9(a), the designation of all Contracting States bound by the PCT on the international filing date, for the grant of every kind of protection available and, where applicable, for the grant of both regional and national patents.

However,

- ☐ DE Germany is **not designated** for any kind of national protection
- ☐ KR Republic of Korea is **not designated** for any kind of national protection
- ☐ RU Russian Federation is **not designated** for any kind of national protection

(The check-boxes above may be used to exclude (irrevocably) the designations concerned in order to avoid the ceasing of the effect, under the national law, of an earlier national application from which priority is claimed. See the Notes to Box No. V as to the consequences of such national law provisions in these and certain other States.)

Box No. VI PRIORITY CLAIM

The priority of the following earlier application(s) is hereby claimed:

Filing date of earlier application (day/month/year)	Number of earlier application	Where earlier application is:		
		national application: country or Member of WTO	regional application:* regional Office	international application: receiving Office
item (1) 24/May/2003 24/05/2003	60/473,237	US		
Item 2) 17/November/2003 17/11/2003	10/714,824	US		
item (3) 09/March/2004 09/03/2004	60/552,018	US		

☐ Further priority claims are indicated in the Supplemental Box.

The receiving Office is requested to prepare and transmit to the International Bureau a certified copy of the earlier application(s) (only if the earlier application was filed with the Office which for the purposes of the present international application is the receiving Office) identified above as:

☒ all items ☐ item(1) ☐ item(2) ☐ item(3) ☐ item(4) ☐ item(5) ☐ other, see Supplemental Box

* Where the earlier application is an ARIPO application, indicate at least one country party to the Paris Convention for the Protection of Industrial Property or one Member of the World Trade Organization for which that earlier application was filed (Rule 4.10(b)(ii)):

Box No. VII INTERNATIONAL SEARCHING AUTHORITY

Choice of International Searching Authority (ISA) (if two or more International Searching Authorities are competent to carry out the international search, indicate the Authority chosen; the two-letter code may be used):

ISA/US

Request to use results of earlier search; reference to that search (if an earlier search has been carried out by or requested from the International Searching Authority):

Date (day/month/year) 17/11/2003 Number 10/714,824 Country (or regional Office) US

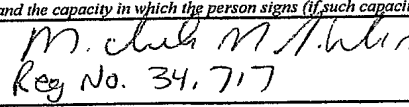

Box No. VIII DECLARATIONS

The following **declarations** are contained in Boxes Nos. VIII (i) to (v) (mark the applicable check-boxes below and indicate in the right column the number of each type of declaration):

Number of
declarations

- | | | |
|--|--|---|
| <input type="checkbox"/> Box No. VIII(i) | Declaration as to the identity of the inventor | : |
| <input type="checkbox"/> Box No. VIII(ii) | Declaration as to the applicant's entitlement, as at the international filing date, to apply for and be granted a patent | : |
| <input type="checkbox"/> Box No. VIII(iii) | Declaration as to the applicant's entitlement, as at the international filing date, to claim the priority of the earlier application | : |
| <input type="checkbox"/> Box No. VIII(iv) | Declaration of inventorship (only for the purposes of the designation of the United States of America) | : |
| <input type="checkbox"/> Box No. VIII(v) | Declaration as to non-prejudicial disclosures or exceptions to lack of novelty | : |

Box No. IX CHECK LIST; LANGUAGE OF FILING

SKIN TANNING AND LIGHT THERAPY SYSTEM AND METHOD

FIELD OF THE INVENTION

[0001] The present application claims benefit of U.S. Provisional Patent Application Serial Number 60/473,237, filed May 24, 2003, U.S. Patent Application Serial Number 10/714,824 filed November 17, 2003 and U.S. Provisional Patent Application Serial Number 60/552,018, filed March 9, 2004, which are incorporated by reference in their entirety.

[0002] The present invention is directed generally to tanning and phototherapy systems and specifically to systems which incorporate nanostructure UV radiation sources.

BACKGROUND OF THE INVENTION

[0003] The most common method of skin tanning involves the process of exposing skin to ultra-violet light. Health research has shown that both the condition of under-exposure to ultra-violet light and the condition of over-exposure to ultra-violet light causes a variety of health problems. Health research has also shown that specific ranges of wavelengths of ultra-violet light are responsible for producing health benefits. Moderate exposure to specific wavelengths of ultra-violet light produces the greatest benefits with the least amount of health risk. Certain methods and devices are useful at controlling the quantity and quality of ultra-violet light exposure in the effort to produce the greatest health benefits with the least amount of health risks. Ultra-violet light quality depends primarily on the ranges of wavelength of ultra-violet light; where the highest ultra-violet light quality is the ultra-violet light that produces the greatest net health benefits.

[0004] The sun is a primary source of ultra-violet light for tanning. The quantity of light exposure to the sun is simple to control. The quality of ultra-violet light exposure by the sun is not simple to control. Lamps that provide alternative sources of ultra-violet light allow for tanning services that do not

rely on the sun. These tanning services are available and are administered in a controlled environment such as in personal care service salons. The industry providing controlled exposure to artificial ultra-violet light is generally referred to as the "indoor-tanning" industry. Indoor-tanning does not implement systems that are directly dependent on the sun as the source of ultra-violet radiation. The quality of the indoor-tanning ultra-violet light has become important in differentiating services available within the same indoor-tanning salon and between competing tanning salons.

[0005] Light with wavelengths in the ultra-violet range is often referred to as UV light or UV. UVA, UVB and UVC describe three separate non-overlapping but adjacent ranges of light fully encompassing the UV light range. The range of light referred to as UVA generally has the longest set of wavelengths within the UV range and includes wavelengths between 290 and 400. UVA-1 is between 340 and 400; UVA-2 is between 290 and 340; and UVA-3 is between 290 and 310. The range of light referred to as UVC generally has the shortest set of wavelengths within the UV range and includes wavelengths between 160 and 260. The range of light referred to as UVB includes wavelengths between 260 and 290.

[0006] The use of the terms UVA, UVB and UVC allow the various properties of UV light to be categorized in general ways. UVA has the best capability of tanning skin. UVB does not produce a tan in the third layer of skin. UVC light does not produce a tan but can sterilize some biological agents such as certain bacteria. Under certain conditions UVB will tan the second layer of skin. The second layer of skin when tanned with UVB has a shedding period of 5 to 8 days. Skin tanned with UVA only has the third layer of skin tanned which results in a normal shedding cycle of 28 days.

[0007] Under normal conditions the outer layer of skin, also known as the first layer, is composed of dead cells. Normally, dead cells will not produce melanin upon exposure to moderate amounts of UV. The layer under the first layer of skin is referred to as the second layer of skin, and is composed of

active cells that may be functioning in some biological manner and will produce melanin upon exposure to UVB light. UVB skin tanning has, what some tanners consider, an additional negative effect, UVB tanning will thicken the second layer of skin and as a result increases the visibility of skin lines and wrinkles. UVB tanning creates a shedding cycle of 5 to 7 days which is undesirable when a UVA tan has a shedding cycle of 28 days. When UVB is combined with UVA the shedding cycle of the UVA tanned layer is accelerated since the second layer is shed more quickly and the third layer becomes the second layer as a result and is shed within another 5 to 7 days.

[0008] Under normal conditions the layer of skin that will produce melanin when exposed to UVA light is referred to as the third layer of skin. In exceptional conditions such as albinism, the third layer of skin is not capable of producing melanin. For the purposes of this application, albino skin is considered an exception to the norm and will not be referred to as a third layer of skin but as an albino third layer of skin.

[0009] It is common knowledge that all wavelengths of UV over long exposure periods damages the skin in various ways. Therefore, it is desirable to limit the exposure of UV radiation to skin. Alternatively, some UV exposure is generally considered necessary in order to maintain good health in other bodily functions, such as the generation of vitamin-D. Vitamin-D is useful in the absorption of calcium in the body. Therefore, it has been recommended by various health organizations studying the phenomena that moderate exposure to UV light has a net health benefit, whereas over-exposure or under-exposure of UV results in a net health deficit. The art of indoor-tanning to remain useful should provide for ever increasing controllability of the application of the light therapy. As a light therapy tanning should be applied with specific goals and procedures to maximize the benefits of the therapy.

[0010] For people desiring a tan, the main benefits of UV exposure is the production of tanned skin. Tanners enjoy positive psychological and perceived positive social benefits resulting from having tanned skin. In order to limit the

total amount of UV radiation tanners are exposed to while maintaining a tan, it is desirable to reduce as much as possible the exposure to UV light outside the UVA wavelength range. UVB and UVC wavelength ranges of radiation are by definition not capable of tanning skin with a 28 day shedding cycle and therefore reasonable efforts should be made to eliminate UVB and UVC from the source of light tanners are exposed to.

[0011] Indoor-tanning methods generate UV light from converting electrical energy to light within devices such as UV fluorescent bulbs and high and low pressure mercury vapor bulbs, are two specific types of light bulb technologies. UV light bulbs currently in use have properties of high voltage, high temperature, and low electrical energy to UV conversion efficiencies under seventeen percent.

[0012] Within the fluorescent light bulb category there are a variety of types that differ mainly in the percentage of UV light produced in the UVA, UVB and UVC wavelength ranges. For tanners concerned with overexposure to UV light the more desirable fluorescent bulbs have a higher percentage of light in the UVA-1 wavelength range. Tanners concerned with overexposure prefer and tend to pay a premium for tanning services that have the least amount of UVB and UVC.

[0013] Depending on weather conditions, typically 88% of the UV radiation from the sun is UVA, in this case an artificial source with more than 88% of the UV radiation is UVA is considered a safer tanning method than sun-tanning. Common fluorescent tanning bulbs and associated services have UV composed between 92.0% UVA to 97.5% UVA. Currently, high pressure quartz metal-halogenide bulbs have in general 98.5% UVA and are considered to be the least harmful artificial tanning bulbs currently used in indoor-tanning salons.

BRIEF SUMMARY OF THE INVENTION

[0014] A preferred embodiment of the present invention provides a system for at least one of skin tanning and phototherapy, comprising a chamber adapted for at least one of skin tanning and phototherapy, and a nanostructure UV light emitting device.

[0015] Another preferred embodiment of the present invention provides a system for at least one of skin tanning and phototherapy, comprising a first means for at least one of skin tanning and phototherapy, and a nanostructure UV light emitting device.

[0016] Another preferred embodiment of the present invention provides a method for at least one of skin tanning and phototherapy, comprising providing UVA light from a nanostructure UV light emitting device onto a skin of a human subject who is located in a chamber adapted for at least one of skin tanning and phototherapy in order to at least one of tan the skin and to provide phototherapy for the skin.

BRIEF DESCRIPTION OF THE DRAWINGS

[0017] Figures 1A and 1B are schematic side views of systems according to embodiments of the present invention.

[0018] Figures 2, 3, 4A, 4B, 5 and 6 are cross sectional side views of nanostructure UV light emitting devices according to embodiments of the present invention.

[0019] Figure 7 is a bottom view of a nanostructure UV light emitting device according to an embodiment of the present invention.

[0020] DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

[0021] The present inventor has realized that a system for at least one of skin tanning and phototherapy may use a nanostructure UV light emitting

device. This allows a control of the peak wavelength of the UV light as well as provides UV light with a narrow wavelength distribution (i.e., a narrow peak width). Figures 1A and 1B illustrate the system 1 which contains a chamber 3 adapted for at least one of skin tanning and phototherapy and the nanostructure UV light emitting device 5. The system 1 may be used solely for skin tanning or for phototherapy or for both skin tanning and phototherapy depending on the need of the person being subjected to the UV light. Figure 1A illustrates an indoor tanning or phototherapy system for the prone body position, which is commonly referred to as a tanning or a phototherapy bed. Figure 1B illustrates an indoor tanning or phototherapy system for upright body positions, which is commonly referred to as a tanning or a phototherapy booth.

[0022] The nanostructure UV light emitting device comprises at least one of a nanoparticle and a nanowire UV light emitting device. Preferably, the UV light emitting device emits only UVA light. The term UV light includes radiation having a peak wavelength between 160 and about 400 nm rather than visible light having a wavelength between above about 400 and below about 700 nm. UVA light has a peak wavelength between about 290 and about 400 nm. The nanoparticles and nanowires emit light (i.e., radiation) with a very narrow peak width due to their size rather than due to their chemical composition. Thus, in contrast to conventional ceramic phosphors which emit light with a broad peak width due to their chemical composition and activator ion content, nanoparticles and nanowires emit light with varying peak wavelength due to varying their size (i.e., diameter or thickness). Furthermore, some materials, such as silicon, which ordinarily do not emit light in bulk form, emit light in nanoparticle form due to the nanoparticle size. Thus, the nanoparticle or nanowire size may be selected such that the nanoparticles or nanowires emit only UVA light, but no UVB light. Furthermore, nanoparticle or nanowire size may be selected such that the nanoparticles or nanowires emit only UVA-1, UVA-2 and/or UVA-3 light

depending on the desired effect, since the peak width of the emitted UV light is narrow.

[0023] Nanoparticles may be any suitable nanoparticles, such as nanocrystals or quantum dots, having a diameter less than 100 nm, such as a diameter of 2-20 nm, for example. For example, metal, semiconductor, as well as metal or semiconductor oxide and/or nitride nanoparticles may be used. Semiconductor nanoparticles include materials from Groups IV (Si, Ge, SiC, SiGe), II-VI (CdS, ZnS, CdSe, ZnSe, ZnTe, CdTe), IV-VI (PbS, PbSe, PbTe) or III-V (GaAs, GaP, GaN, InP, InAs). Ternary and quaternary semiconductor nanoparticles, such as CdZnS, CdZnSe, CdZnTe, CdZnTeSe, CdZnSSe, GaAlAs, GaAlP, GaAlN, GaInN, GaAlAsP and GaAlInN for example, may also be used. Ceramic or metal oxide nanoparticles may also be used, such as silica, alumina, titania, zirconia, yttria stabilized zirconia, yttria, ceria, spinel (for example, $\text{MgO} \cdot \text{Al}_2\text{O}_3$) and tantalum pentoxide, as well as other suitable ceramics having a more complex structure, such as radiation emitting phosphors (for example, YAG:Ce ($\text{Y}_3\text{Al}_5\text{O}_{12}:\text{Ce}$)) and various halophosphate, phosphate, silicate, aluminate, borate and tungstate phosphors) and scintillators (for example, LSO, BGO, YSO, etc.). Other metal oxide nanoparticles, such as zinc oxide, indium oxide or indium tin oxide or metal nitride nanoparticles, such as aluminum nitride may also be used. Metal nanoparticles may be pure metal or metal alloy nanoparticles, such as Al, Fe, Cu, Ni, Au, Ag, Pt, Pd, Ti, V, Ta, W, Mn, Zn, Mo, Ru, Pb, Zr, etc. and alloys thereof.

[0024] Other materials, such as Boron Carbide, Titanium Oxide (TiO), Silicon Carbide (SiC), Antimony (Sb), Arsenic (As), Bismuth (Bi), Cadmium (Cd), Carbon (C), Gallium (Ga), Germanium (Ge), Indium (In), Phosphorus (P), Selenium (Se), Sulfur (S), Tellurium (Te), Calcium (Ca), Chromium (Cr), Cobalt (Co), Magnesium (Mg), Tantalum (Ta), Silicon Arsenide Germanium Telluride (SiAsGeTe), Vanadium Oxide, Zinc Germanium Phosphide (ZnGeP_2), Zinc Germanium Phosphide (ZnGeP), Aluminum Antimonide

(AlSb), Aluminum Arsenide (AlAs), Aluminum Phosphide (AlP), Gallium Selenide (GaSe), Gallium Telluride (GaTe), Indium Antimonide (InSb) and Silicon Arsenide Telluride (SiAsTe) may also be used.

[0025] Nanoparticles may be provided in the UV light emitting device 5 in any suitable form. For example, the nanoparticles may be located as a solid layer or layers on a UV transparent and UV resistant material substrate. The solid layer may also contain a UV transparent and UV resistant binder or filler if desired. Alternatively, the nanoparticles may be located in a suspension. The fluid of the suspension may comprise any suitable UV transparent fluid. Preferably, the fluid comprises a fluorocarbon fluid, such as perfluorocarbon, chlorofluorocarbon or hydrofluorocarbon fluid. For example, the fluid may comprise 1,1,1,2 tetrafluoroethane also known as R134A or perfluorocarbon fluids sold under the PPx series from F2 Chemicals Ltd. in Lea Town, U.K., such as the PP6 perfluorocarbon fluid. The R134A fluid is provided under elevated pressure to remain in the liquid state at room temperature. Other fluids which are liquid at atmospheric pressure at room temperature may also be used. If the nanoparticles are located in a suspension, then the suspension is located in a sealed vessel or tube made of a UV transparent and UV resistant material. If desired, the device 5 may also contain a pump or vibrator which maintains the suspension under turbulent flow to prevent the nanoparticles from settling on the surface of the vessel.

[0026] Nanowires may be any suitable nanowires having a thickness (i.e., diameter) of less than 150 nm, such as a thickness of 70-100 nm, for example. The nanowires may comprise any suitable material, such as metal oxide material. For example, zinc oxide, indium oxide and indium tin oxide nanowires may be used. Any suitable length of nanowires may be used.

[0027] The system 1 further preferably comprises a UV excitation source 7. The source 7 is positioned to provide UV excitation radiation of a first peak wavelength onto the nanostructure UV light emitting device 5 to cause the nanostructure UV light emitting device to emit UVA light having a

second UVA peak wavelength longer than the first peak wavelength. Any suitable UV excitation source may be used.

[0028] In one preferred embodiment shown in Figure 2, the UV excitation source 7 comprises a gas vessel comprising a gas which is adapted to emit the UV excitation radiation in response to a stimulus. For example, the source may be a gas lamp tube filled with a gas such as Ar or Hg which emits UV radiation when a voltage is applied to the electrodes 9 of the gas tube. The UV light emitting device 5 in this embodiment comprises at least one layer of nanoparticles coated on an inner surface of at least one UV light transparent wall of the gas vessel or tube 7. In other words, the conventional phosphor in a fluorescent lamp 7 is replaced with or combined with one or more layers of nanoparticles which emit UVA light in response to UV excitation radiation emitted by the gas. In this case, rather than using an expensive UV emitting lamp, a cheap germicidal or white light emitting lamp may be used instead, but with replacing the white light emitting phosphor with UVA light emitting nanoparticles. Preferably plural layers of nanoparticles are coated on the inner surface of the gas tube or vessel 7 to prevent the UVB or UVC radiation emitted by the gas, such as 254 nm UVC radiation, from being incident on the skin of a person in the tanning or phototherapy chamber 3. The UV exciting radiation from the gas in vessel 7 is incident on the nanoparticles 5, which emit UVA light in response to the incident radiation. The nanoparticles 5 block the UV excitation radiation, such as UVC radiation, from exiting the vessel or tube 7.

[0029] In another preferred embodiment shown in Figure 3, the UV excitation source 7 comprises any suitable UV lamp which optionally contains a UV emitting phosphor 6 on its inner walls. The UV light emitting device 5 comprises at least one layer of nanoparticles coated on an outer surface of the UV lamp 7. The UV exciting radiation from the lamp from the lamp 7 is incident on the nanoparticles 5, which emit UVA light in response to the incident radiation.

[0030] Various other UV excitation sources 7 may be used. For example, the UV excitation source may comprise a focusing lens which focuses solar radiation onto the UV light emitting device. Furthermore, while an optical UV excitation source 7 is preferred, in an alternative aspect of the invention, an electrical excitation source may be used instead. In this case, the nanoparticles or nanowires 5 are located between two electrodes. At least one electrode is preferably made of an electrically conductive and UV transparent material, such as indium oxide, tin oxide or indium tin oxide (ITO). When a voltage is applied between the electrodes, the voltage causes the nanoparticles or nanowires to emit UV light.

[0031] It should be noted that the nanoparticles or nanowires 5 do not have to be placed directly on the UV excitation source 7. The nanoparticles or nanowires may be located on a separate substrate, such as a UV transparent substrate, or in a separate suspension in a vessel, which is located between the UV excitation radiation source 7 and the portion of the chamber 3 which houses the person undergoing tanning or phototherapy.

[0032] In a third embodiment shown in Figure 4A, the UV light emitting device 5 comprises a plurality of layers of nanoparticles or nanowires arranged in a direction extending from the UV excitation radiation source 7 to the portion of the chamber 3 which houses the person undergoing tanning or phototherapy. The nanoparticles or nanowires in each layer emit radiation having a different peak wavelength from the nanoparticles or nanowires in other layers. Preferably, the peak wavelength of the UV radiation emitted by the nanoparticles or nanowires increases in each subsequent layer in the direction from the UV excitation source 7 to the portion of the chamber 3 which houses the person undergoing tanning or phototherapy. In other words, the nanoparticles or nanowires in each layer located closer to the person's skin (i.e., farther from the UV excitation source 7) emit radiation of a longer wavelength than those in another layer located farther from the person's skin (i.e., closer to the UV excitation source 7). This allows the

stacked layers of nanoparticles or nanowires to gradually or stepwise upconvert the UVB and/or UVC radiation emitted by the UV excitation radiation source 7 to desired UVA radiation. There may be two or more layers of nanoparticles or nanowires.

[0033] For example, as shown in Figure 4A, the UV excitation radiation source 7 may emit 254 nm peak UVC radiation. A first layer 11 of first nanoparticles or nanowires is located proximal to the UV excitation source 7. The first nanoparticles or nanowires emit UV light of a third peak wavelength, such as 315-340 nm, which is longer than the 254 nm peak wavelength, when irradiated with the UV excitation radiation from source 7. A second layer 13 of second nanoparticles or nanowires is located distal from the UV excitation source, such that the first layer 11 is located between the second layer 13 and the UV excitation source 7. The second nanoparticles or nanowires emit UV light of the second peak wavelength longer than the third peak wavelength when irradiated with the UV light from the nanoparticles or nanowires of the first layer 11. For example, the nanoparticles or nanowires of the second layer 13 may emit UVA-1 radiation having a peak wavelength of 345-355 nm or 395-405 nm when irradiated with UVA-2 or UVA-3 radiation from the first layer 11. Additional layers of nanoparticles or nanowires may be located between layers 11 and 13 to make the radiation wavelength upconversion (i.e., energy down conversion) even more gradual.

[0034] Layers 11, 13 may be formed directly on each other with the UV excitation source 7 acting as a substrate. Alternatively, each layer 11, 13 may be spaced apart from the adjacent layer and each layer may be formed on a separate UV transparent substrate, such as glass, plastic or quartz substrate, or in a separate solution holding vessel.

[0035] Figure 4B illustrates an alternative aspect of the third embodiment. In this aspect, three layers of nanoparticles or nanowires 11, 12 and 13 are arranged in a clam-shell type housing 25 comprising an opaque body. The UV excitation source 7 is located in the interior portion of the housing 25. A

mirror 27 shields the back side of the source 7. The first layer 11 of nanoparticles or nanowires is located opposite to the source 7 and mirror 27, such that UV excitation radiation from source 7 and mirror 27 is incident on the first layer 11. The second layer 12 of nanoparticles or nanowires emits UV light having a peak wavelength between those of the first 11 and third 13 layers. The second layer 12 is positioned in the housing to receive UV light from the first layer 11 and to emit UV light of a longer wavelength onto the third layer 13. The third layer 13 is positioned to receive UV light from the second layer 12 and to emit UV light of an even longer wavelength out of the housing through a lens 29 and through an optional long wavelength filter, which blocks shorter wavelength UV light from the source 7, first layer 11 and second layer 12 from exiting the housing 25. If desired, a light absorbing surface may be located behind the layers 11, 12 and 13. It should be noted that the term "layer" as used herein includes a nanoparticle or nanowire solid layer as well as a nanoparticle suspension located in a vessel. By using the clam-shell shaped housing 25, UV light of one or more desired wavelengths from layers 11, 12 and/or 13 exits the housing 25.

[0036] In a fourth embodiment of the present invention shown in Figure 5, an optical filter 15 is located between the UV excitation source 7 and the UV light emitting device 5. The filter 15 is transparent to the shorter wavelength UV excitation radiation from source 7. However, the filter 15 reflects UV light of a longer peak wavelength emitted by the UV light emitting device 5. The filter 15 may be a holographic filter or any other suitable filter having the above described property. This configuration is advantageous when nanoparticles are used as the light emitting device 5. The nanoparticles emit UV light in all directions. However, the filter 15 reflects UV light emitted toward the source 7 back in the direction of the portion of the chamber 3 in which the person is to be located.

[0037] The fifth embodiment is a combination of the third and fourth embodiments. As shown in Figure 6, the UV light emitting device 5 comprises

a plurality of layers 11, 13 of nanoparticles or nanowires arranged in a direction extending from the UV excitation radiation source 7 to the portion of the chamber 3 which houses the person undergoing tanning or phototherapy. The nanoparticles or nanowires in each layer 11, 13 emit radiation having a different peak wavelength from the nanoparticles or nanowires in other layers. The peak wavelength of the UV radiation emitted by the nanoparticles or nanowires increases in each subsequent layer in the direction from the excitation radiation source 7 to the portion of the chamber 3 which houses the person undergoing tanning or phototherapy. A filter 17 is located between adjacent layers of nanoparticles or nanowires. The filter 17 is transparent to the shorter wavelength UV light from the layer 11 proximal to the UV excitation source 7. However, the filter 17 reflects UV light of a longer peak wavelength emitted by layer 13 distal from the UV excitation source 7. If the device 5 contains more than three layers of nanoparticles or nanowires, then a different filter may be located between each pairs of layers.

[0038] In a sixth embodiment, the nanoparticles or nanowires are arranged in pixels as shown in Figure 7. The nanoparticles or nanowires in each pixel can be separately activated by a dedicated UV excitation radiation source or by dedicated electrodes to selectively tan or treat a desired portion of skin on the person undergoing tanning or phototherapy. In one aspect of the sixth embodiment, the UV light emitting device 5 includes a first set of pixels 19 of first nanoparticles or nanowires. The first nanoparticles or nanowires are adapted to emit UV light having a predetermined first peak wavelength. The device 5 also includes a second set of pixels 21 of second nanoparticles or nanowires. The second nanoparticles or nanowires emit UV light of the second peak wavelength longer than the first peak wavelength. If desired, additional sets of pixels may be provided. Pixels of the first set of pixels 19 are interspersed with pixels of the second set of pixels 21.

[0039] All pixels may be turned on at once to provide UV light having a plurality of different peak wavelengths or one set of pixels may be selectively

activated while the other sets remain turned off. In this case, the peak wavelength of the UV light may be selectively tailored for each individual based on the desired darkness of the tan, the individual's skin color or a selection of a particular wavelengths to treat a particular condition during phototherapy.

[0040] In a seventh embodiment, the system 1 contains the UV light emitting device 5 with exchangeable nanoparticles or nanowires to vary the peak emission wavelength of the device 5. For example, if the nanoparticles are located in a suspension in a sealed vessel, then the vessel may be opened and the suspension replaced by another suspension having nanoparticles which emit light of a different wavelength from the nanoparticles in the original suspension. Preferably, the vessel comprises non-stick surfaces to prevent nanoparticle adhesion. Alternatively, the entire vessel housing the suspension may be removed from the system and replaced with another vessel containing a different suspension of different nanoparticles which emit light of a different peak wavelength than the nanoparticles of the original suspension. If the nanoparticles or nanowires are coated as a solid layer on a substrate or substrates, then the substrate or substrate may be easily removable from the system to allow the system operator to insert a substrate or substrates containing nanoparticles or nanowires which emit light of a desired peak wavelength into the system 1.

[0041] A method of operating the system 1 for at least one of skin tanning and phototherapy includes providing UVA light from a nanostructure UV light emitting device 5 onto a skin of a human subject who is located in a chamber 3 adapted for at least one of skin tanning and phototherapy in order to at least one of tan the skin and to provide phototherapy for the skin. Phototherapy includes but is not limited to scleroderma therapy, psoriasis therapy, lupus therapy, photopheresis, and photochemotherapy.

[0042] The method also includes providing UV excitation radiation of a first peak wavelength from a UV excitation source 7 to the UV light emitting

device 5. The method also includes emitting the UVA light having a second UVA peak wavelength longer than the first peak wavelength from the UV light emitting device 5 in response to the provided UV excitation radiation.

[0043] In an eighth embodiment, blue light having a wavelength of about 400 to about 415 nm, such as about 405 nm is used instead of UV light. Light of this wavelength is sometimes called violet or purple rather than blue. Any suitable blue or violet light emitting device 5 which emits light of this wavelength may be used, including a lamp, a light emitting diode, nanoparticle or nanowire containing device 5. The light emitting diode, nanoparticles and nanowires are preferred because they have a narrower emission peak width. For light emitting diodes, blue light emitting diodes based on GaN, SiC or ZnSe semiconductor materials may be used. Tanning with light in the 400-415 nm wavelength range may provide a longer lasting tan than tanning with UV light. Preferably but not necessarily, the light emitting device emits light having substantially no wavelengths outside the about 400 nm to the about 415 nm range, such as emitting less than 1% of light having wavelengths outside the about 400 nm to the about 415 nm range. The device 5 of this embodiment may be used in combination with the configuration(s) of the other embodiments described herein.

[0044] The foregoing description of the invention has been presented for purposes of illustration and description. It is not intended to be exhaustive or to limit the invention to the precise form disclosed, and modifications and variations are possible in light of the above teachings or may be acquired from practice of the invention. The drawings and description were chosen in order to explain the principles of the invention and its practical application. It is intended that the scope of the invention be defined by the claims appended hereto, and their equivalents.

WHAT IS CLAIMED IS:

1. A system for at least one of skin tanning and phototherapy, comprising:
a chamber adapted for at least one of skin tanning and phototherapy;
and
a nanostructure UV light emitting device.
2. The system of claim 1, wherein the system is adapted for skin tanning.
3. The system of claim 1, wherein the system is adapted for phototherapy.
4. The system of claim 1, wherein the system is adapted for both skin tanning and phototherapy.
5. The system of claim 1, wherein the chamber comprises a bed.
6. The system of claim 1, wherein the chamber comprises a booth.
7. The system of claim 1, wherein the nanostructure UV light emitting device comprises at least one of a nanoparticle and a nanowire UVA light emitting device.
8. The system of claim 7, further comprising a UV excitation source which is positioned to provide UV excitation radiation of a first peak wavelength onto the nanostructure UV light emitting device to cause the nanostructure UV light emitting device to emit UVA light having a second UVA peak wavelength longer than the first peak wavelength.
9. The system of claim 8, wherein the UV light emitting device comprises nanoparticles having an average diameter smaller than 100 nm.

10. The system of claim 8, wherein the UV light emitting device comprises nanowires having an average thickness smaller than 150 nm.
11. The system of claim 8, wherein the UV light emitting device comprises a UVA-1 light emitting device.
12. The system of claim 8, wherein the UV light emitting device comprises:
a first layer of first nanoparticles or nanowires located proximal to the UV excitation source, wherein the first nanoparticles or nanowires emit UV light of a third peak wavelength longer than the first peak wavelength when irradiated with the UV excitation radiation; and
a second layer of second nanoparticles or nanowires located distal from the UV excitation source, such that the first layer is located between the second layer and the UV excitation source, wherein the second nanoparticles or nanowires emit UV light of the second peak wavelength longer than the third peak wavelength when irradiated with the UV light from the nanoparticles or nanowires of the first layer.
13. The system of claim 8, wherein:
the UV excitation source comprises a gas vessel comprising a gas which is adapted to emits the UV excitation radiation in response to a stimulus; and
the UV light emitting device comprises at least one layer of nanoparticles coated on an inner surface of at least one UV light transparent wall of the gas vessel.
14. The system of claim 8, wherein the nanoparticles emit only UVA radiation due to their size.
15. The system of claim 8, wherein:

the UV excitation source comprises a UV lamp; and
the UV light emitting device comprises at least one layer of nanoparticles coated on an outer surface of the UV lamp.

16. The system of claim 8, further comprising a filter located between the UV excitation source and the UV light emitting device, wherein the filter is transparent to the UV excitation radiation having the first peak wavelength and the filter reflects UV light of the second peak wavelength emitted by the UV light emitting device.

17. A system for at least one of skin tanning and phototherapy, comprising:
a first means for at least one of skin tanning and phototherapy; and
a nanostructure UV light emitting device.

18. The system of claim 17, wherein the first means is a means for skin tanning.

19. The system of claim 17, wherein the first means is a means for phototherapy.

20. The system of claim 17, wherein the first means is a means for both skin tanning and phototherapy.

21. The system of claim 17, wherein the nanostructure UV light emitting device comprises at least one of a nanoparticle and a nanowire UVA light emitting device.

22. The system of claim 21, further comprising a second means for providing UV excitation radiation of a first peak wavelength onto the nanostructure UV light emitting device to cause the nanostructure UV light

emitting device to emit UVA light having a second UVA peak wavelength longer than the first peak wavelength.

23. The system of claim 22, wherein the UV light emitting device comprises nanoparticles having an average diameter smaller than 100 nm.

24. The system of claim 22, wherein the UV light emitting device comprises nanowires having an average thickness smaller than 150 nm.

25. A method for at least one of skin tanning and phototherapy, comprising providing UVA light from a nanostructure UV light emitting device onto a skin of a human subject who is located in a chamber adapted for at least one of skin tanning and phototherapy in order to at least one of tan the skin and to provide phototherapy for the skin.

26. The method of claim 25, wherein the UVA light tans the skin.

27. The method of claim 25, wherein the UVA light provides phototherapy for the skin.

28. The method of claim 25, wherein the UVA light provides tanning and phototherapy for the skin.

29. The method of claim 25, wherein the chamber comprises a bed.

30. The method of claim 25, wherein the chamber comprises a booth.

31. The method of claim 25, wherein the nanostructure UV light emitting device comprises at least one of a nanoparticle and a nanowire UVA light emitting device.

32. The method of claim 31, further comprising:

providing UV excitation radiation of a first peak wavelength from a UV excitation source to the UV light emitting device; and

emitting the UVA light having a second UVA peak wavelength longer than the first peak wavelength from the UV light emitting device in response to the provided UV excitation radiation.

33. The method of claim 32, wherein the UV light emitting device comprises nanoparticles having an average diameter smaller than 100 nm.

34. The method of claim 32, wherein the UV light emitting device comprises nanowires having an average thickness smaller than 150 nm.

35. The method of claim 32, wherein the UVA light emitted by the UV light emitting device comprises a UVA-1 light.

36. The method of claim 32, wherein the UV light emitting device comprises:

a first layer of first nanoparticles or nanowires located proximal to the UV excitation source, wherein the first nanoparticles or nanowires emit UV light of a third peak wavelength longer than the first peak wavelength when irradiated with the UV excitation radiation; and

a second layer of second nanoparticles or nanowires located distal from the UV excitation source, such that the first layer is located between the second layer and the UV excitation source, wherein the second nanoparticles or nanowires emit UV light of the second peak wavelength longer than the third peak wavelength when irradiated with the UV light from the nanoparticles or nanowires of the first layer.

37. The method of claim 32, wherein:

the UV excitation source comprises a gas vessel comprising a gas which emits the UV excitation radiation in response to a stimulus; and

the UV light emitting device comprises at least one layer of nanoparticles coated on an inner surface of at least one UV light transparent wall of the gas vessel.

38. The method of claim 32, wherein the nanoparticles emit only UVA radiation due to their size.

39. The method of claim 32, wherein:

the UV excitation source comprises a UV lamp; and

the UV light emitting device comprises at least one layer of nanoparticles coated on an outer surface of the UV lamp.

40. The method of claim 25, further comprising a filter located between the UV excitation source and the UV light emitting device, wherein the filter is transparent to the UV excitation radiation having the first peak wavelength and the filter reflects UV light of the second peak wavelength emitted by the UV light emitting device.

41. A system for at least one of skin tanning and phototherapy, comprising:
a chamber adapted for at least one of skin tanning and phototherapy;
and

a light emitting device which emits light having a peak wavelength between about 400 nm and about 415 nm.

42. The system of claim 41, wherein the light emitting device comprises a lamp, a light emitting diode, nanoparticles or nanowires.

43. The system of claim 42, wherein the light emitting device emits light having substantially no wavelengths outside the about 400 nm to the about 415 nm range.

ABSTRACT

A system and method for at least one of skin tanning and phototherapy are provided. The system includes a chamber adapted for at least one of skin tanning and phototherapy and a nanostructure UV light emitting device.
